

Sleep Apnea Hurts HEARTS

Obstructive sleep apnea (OSA) is a chronic disease that involves the repeated collapse of the upper airway during sleep. Sleep apnea puts an enormous strain on your heart, repeatedly causing oxygen levels to drop and blood pressure to surge as you sleep.

Untreated, severe sleep apnea increases your risk of developing heart problems.

People in the U.S. who have sleep apnea

Higher Risk of dying from heart disease

SLEEP APNEA HURTS

By increasing the risk of:

**H
E
A
R
T
S**

- Heart failure
- Elevated blood pressure
- Atrial fibrillation
- Resistant hypertension
- Type 2 diabetes
- Stroke

SEVERE DAMAGE

Increased risk of developing heart failure in middle-aged men with severe sleep apnea

People with high blood pressure who have obstructive sleep apnea

Higher risk of Afib in people who have sleep apnea

People with treatment-resistant hypertension who also have sleep apnea

Sleep apnea afflicts about 7 in 10 people who have Type 2 diabetes.

Increased risk of having a stroke in people with severe, untreated sleep apnea

The effective treatment of sleep apnea is good for your sleep and your heart! It improves your overall health and lowers your risk of heart problems.

DAMAGE CONTROL

Treating sleep apnea with CPAP therapy:

- Restores healthy sleep
- Increases physical energy
- Enhances daytime alertness
- Improves mood
- Reduces the risk of heart damage

Talk to your doctor about your risk for sleep apnea. Your doctor may refer you to a board-certified sleep medicine physician at an accredited sleep center for help.

Warning Signs
Common warning signs for sleep apnea include:

- Snoring
- Silent breathing pauses
- Gasping or choking
- Daytime sleepiness or fatigue

Risk Factors
Factors that increase your risk of having sleep apnea include:

- Obesity (BMI of 30+)
- Narrow airway
- Large neck, tongue or tonsils
- Recessed jaw

Visit projecthealthysleep.org to learn how you can guard your heart and avoid being #SnoredToDeath.
